#### 1. INTRODUCTION:

### 1.1 Project Overview:

This project is

based on Internet Of Things (IoT), that can measure soil moisture, Humidity and temperature conditions for agriculture and crop protection using Watson IoT services. IoT is network that connects physical objects or things embedded with electronics, software and sensors through network connectivity

that collects and transfers data using cloud for communication. Data is transferred through internet without human to human or human to computer interaction.

• In this project we have not used any hardware. Instead of real soil moisture, Humidity and Temperature data obtained from sensors we make use of IBM IoT Simulator which can transmit these parameters as required.

### 2.2 Purpose:

- An intelligent crop protection system helps the farmers in protecting the crop from the animals and birds which destroy the crop.
- This system also helps farmers to monitor the soil moisture levels in the field and also the temperature and humidity values near the field. The motors and sprinklers in the field can be controlled using the mobile application.

#### 2. LITERATURE SURVEY:

## 2.1 Existing Problem:

• Agriculture is a field which forms the basis of our economy. Yet it faces a lot of problems in terms of availability of resources, Irrigation, increasing rate of Pesticides, Climatic disasters, Insects which ruin the crops and makes a huge loss this sector.

- In agriculture water is needed for the crops for their growth. If the Soil gets dry it is necessary to supply water. But sometime if the farmer doesn't visit the field it is not possible to know the condition of soil.
- Sometimes over supply of water or less supply of water affects the growth of crops.
- Sometimes if the weather/temperature changes suddenly it is necessary to take certain actions.
- Specific crops grow better in specific conditions, they may get damaged due to bad weather.

### 2.3 Problem Statement Definition:

- Smart Crop Protection System based on IoT can monitor soil moisture and climatic conditions to grow and yield a good crop.
- The farmer can also get the real time weather forecasting data by using external platforms like Open Weather API.
- Farmer is provided a mobile app using which he can monitor the temperature, humidity and soil moisture parameters along with weather forecasting details.
- Based on all the parameters he can water his crop by controlling the motors using the mobile application.
- Even if the farmer is not present near his crop he can water his crop by controlling the motors using the mobile application from anywhere.
- Here we are using the Online IoT simulator for getting the Temperature, Humidity and Soil Moisture values.

### 3. IDEATION & PROPOSED SOLUTION:

### 3.1 Empathy Map Canvas:

### 3.2 Ideation & Brain Storming:

#### Idea 1:

A centralizing method in the area of IoT (Internet of Things) contrived for understanding agriculture which is preceding the arrangements low-power devices [5]. This paper yields a monitoring procedure for farm safety against animal attacks and climate change conditions. IIoT advances are frequently used in smart farming to emphasize the standard of agriculture[6]. It contains types of sensors, controllers. On behalf of WSN, the ARM Cortex-A board which consumes 3W is the foremost essence of the procedure. Different sensors like DHT 11 Humidity & Temperature Sensor, PIR Sensor, LDR sensor, HC-SR04 Ultrasonic Sensor, and camera are mounted on the ARM Cortex-A board. The PIR goes high on noticing the movement within the scope, the camera starts to record, and the data will be reserved on-board and in the IoT cloud, instantaneously information will be generated automatically towards the recorded quantity using a SIM900A unit to notify about the interference with

the information of the weather conditions attained by DHt11. If a variance happens, the announcement of the threshold rate will be sent to the cell number or to the website. The result will be generated on a catalog of the mobile of the person to take the necessary action.

#### Idea 2:

Low productivity of crops is one of the main problems faced by the farmers in our country. This can be because of two main reasons. Crops destroyed by wild animals and because of bad weather condition. This paper provides a solution to the destruction of crops by animals. This system will provide a complete technical solution using the Internet of things (IOT) to the farmers to prevent their crops from wild animals and provide information to the farmers to maximize their production. Animals are detected using PIR sensors and cameras where animals are identified using TensorFlow image processing Techniques. Raspberry PI is used as the processing unit of the system and sound buzzers are used to emit the ultrasound frequencies.

#### Idea 3:

The Smart protection system defines that this project help to farmer for the protection of a farm. We have designed this project for the only secure from animals but we this project have the provision to secure from the human begins also. This can achieve by the help of IOT device that we are discuss in this paper. The SCPS work on the battery so that this project can be easily portable and also we are add solar panels and converter modules this can help the battery to charge from solar energy. The IOT device is used to indicate the farmer by a message while someone enter into the farm and we are used SD card module that helps to store a specified sound to fear the animals.

## **Brainstorming:**

#### **Brainstorm**

Write down any ideas that come to mind that address your problem statement.

# **3.3 Proposed Solution**

| S.NO. | PARAMETER                            | DESCRIPTION                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------|--------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1.    | Problem Statement                    | Crops are attacked by the animals and birds often. So, the farmers decide to leave the areas barren due to such frequent animal attacks. Another major problem faced by the farmer is their dependency on nature and poorly maintained irrigation system. Current agricultural practice are neither economically nor environmentally sustainable and yields for many agricultural commodities are low. Poorly maintained irrigation system and almost universal lack of good extension service are among the factor responsible. This lead to poor yield of crops and significant financial loss to the owners of the farmland. |
| 2.    | Idea/ Solution description           | Here we propose an automatic crop protection system from animals. This is a microcontroller-based system. This system use a motion sensor to detect wild animals approaching near the field. In such a case the sensor signals the microcontroller to take action.                                                                                                                                                                                                                                                                                                                                                              |
| 3.    | Novelty/ Uniqueness                  | Using IOT and embedded technology,crops are monitored and maintained automatically.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| 4.    | Social Impact/ Customer satisfaction | Farmers get benefitted using this proposed system since this helps in remote monitoring and at the same time maintains the fields.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 5.    | Business Model                       | Prototype type helps in efficient growth of crops and also prevents financial losses and yields high performance.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| 6.    | Scalability of the solution          | With the help of solution sensor and transmission of data through wireless sensor network ,the data is processed in the cloud and operation is performed by robots.                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

## 3.4 Problem Solution Fit

| 1. CUSTOMER SEGMENT(S)  Farmers who are trying to protect their crops are the customers.                                                                                                                                                                                                                       | Adoption cost is high for security concerns.     Customer is not aware of the lot in agriculture.     Customer is.                                                                                                                       | CCTV camera installed to monitor the crops     Web application can be used for maintenance of crops                                                                      |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Irrigation is not done properly     Crops are not maintained properly.     Difficult to monitor and control     Lack of protection of crops from     Wild animals, birds, pests     Lack of knowledge about the application.                                                                                   | 9. PROBLEM ROOT / CAUSE  Due to temperature, climate, soil quality which causes destruction in crops.  Due to less productivity, farmers are affected with their profit.  PH value, light intensity creates serious cause of environment | Takes more time in cropland For an existing solution, searching for an alternate solution. Placed in rural area where network is not proper for fast transmission speed. |
| TRIGGERS TO ACT     Educating farmers about the latest technologies.     Opportunities to be created to uplift people from poverty.  4. EMOTIONS BEFORE / AFTER     Frustrations created due to insufficient production of crops, heavy workload.     Easier to follow the latest technology and reduce costs. | "IOT based smart crop protection system for agriculture"  • Farmers grow more food on less land by protection from weeds and productivity is increased per hectare.                                                                      | Data is send to farmers through application to know about farm  OFFLINE     Giving awareness on application of the device among farmers.                                 |

## **4.REQUIREMENT ANALYSIS**

## **4.1 Functional requirements**

| S.No. | Functional Requirement | Description                                                                                                                                        |
|-------|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|
| 1.    | User Visibility        | Cloud services are used to send SMS to farmers and sound an alert when it detects animals approaching the field to entice them away.               |
| 2.    | User Reception         | Data such as sensor readings for soil moisture, humidity, and temperature are obtained by SMS.                                                     |
| 3.    | User Understanding     | Using sensor data values, information on the current state of farming land is obtained.                                                            |
| 4.    | User Action            | The user must take action by destroying crop residues, deep ploughing, rotating crops, applying fertilizers, and planting crops on a set schedule. |

## **4.2 Non-functional requirements**

| S.NO. | Non-Functional<br>Requirement | Description                                                                                                                                                                 |
|-------|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1.    | Usability                     | Users should experience the same interaction in mobile support as that of being experienced via computer devices                                                            |
| 2.    | Security                      | Implementation of secure access of data for the authorized users to communicate and exchange data.                                                                          |
| 3.    | Reliability                   | It has the ability to detect the disturbance with accuracy.                                                                                                                 |
| 4.    | Performance                   | Responses in considerable amount of time irrespective of the quantitative data that need to be processed in backend. Acting as a bidirectional and real time communication. |
| 5.    | Availability                  | Provides 24/7 functioning as IOT solutions and domains are widely used and production does not get delayed even if the IOT solution is down.                                |
| 6.    | Scalability                   | System handles the upcoming extra load depending on the needs of upscaling of the solution scope for instance, adding extra features.                                       |

Velocity:

Imagine we have a 10-day sprint duration, and the velocity of the team is 20 (points per sprint). Let's calculate the team's average velocity (AV) per iteration unit (story points per day)

$$AV = \frac{sprint\ duration}{velocity} = \frac{20}{10} = 2$$

$$AV = \frac{sprint\ duration}{velocity}$$

=6/13.25

| Final Report Output | 5              | 0             | 0    | 5    |
| Version Control     | 3              | 0             | 1    | 2    |

#### 9.RESULT

We have successfully built an IOT Based Smart Crop Protection System for Agriculture and integrated all the services using Node-RED.

#### 10.ADVANTAGES AND DISADVANTAGES

#### 10.1 Advantages

- All the data like climatic conditions and changes in them, soil or cropconditions everything can be easily monitored.
- Risk of crop damage can be lowered to a greater extent.
- Many difficult challenges can be avoidedmaking the processautomated and thequality of crops can be maintained.
- The process included in farming can be controlled using the web applications from anywhere, anytime.

### 10.2 Disadvantages

- Smart Crop Protection requires internet connectivity continuously, but rural partscan not fulfill this requirement.
- 1. Any faults in the sensors can cause great loss in the agriculture, due to wrong records and the actions of automated processes.
- 2. IoT devices need much money to implement.

#### 11.CONCLUSION

IoT based smart Crop Monitoring System for Agriculture for Live Monitoring of Temperature and Soil Moisture and to control motor and light remotely has been proposed usingNode Red and IBM CloudPlatform. The Systemhas high efficiency and accuracy in fetching the live data of temperature and soil moisture. The IoT based smart farming System being proposed via this project will assist farmers in increasing theagriculture yield and take efficient care of food production as the System will always provide helpinghand to farmers for gettingaccurate live feed of environmental temperature and soil moisture with more than 99% accurate results. Therefore, the project proposesa thought of consolidating the most recentinnovation into the agrarian field to turn the customary techniques for water system to current strategies in this way making simple profitable and temperate trimming.

#### 12.FUTURE SCOPE

In future due to more demand of good and more farming in less time, for betterment of the crops and reducingthe usage of extravagant resourceslike electricity and water IoT can be implemented in most of the places.
